“

To eliminate performance problems on our production systems we needed to implement a multi-terabyte ODS. Our first increment was built using traditional tooling (Oracle Warehouse Builder) . We needed to unveil new sources quickly, offering a more robust and better performing ODS while at the same time reducing the time to market. The traditional project approach and tooling were unable to meet these demands within the time constraints of the project.

DataJini ods met our expectations by automating the majority of this development and deployment work. DataJini ods also maximized the utilization of our Oracle RAC cluster and enables us to load even the biggest tables in a tight nightly batch-window. DataJini ods has been running in our production environment since December 2006, and forms part of the foundation for our corporate wide Business Intelligence Solution.
